

too much.

I think one other thing perhaps ought to be added and that is apart from this question of the time when man was created, I understand - I haven't worked in this field at all but I've been informed by those who seem to know - that if you take the fossils of man, take the early forms of man that have been found and date them according to geology and arrange these early men in these different forms, you find that the earliest ones are very, very similar to man as he is on the earth today and that the ones that seem to be quite different than ordinary men in the world today are late rather than early. And this looks very much against any theory of evolution. It looks as if man, as long as he's been on the earth, has been pretty near the same as he is today. And as a matter of fact if you would take the unusual types of men that have been found, that there've been a few bones found of them, and if you take away the imagination of the artist of the kind of hair that he puts on them and all that sort of thing in the pictures they draw, and just take the actual bones as they are found there, you probably would find unusual people on the earth today who aren't so very dissimilar from it - because there is considerable variety among men on the earth today. But there is no progression in the forms of man that is found from those quite different from present to the same. But the ones that are different are late rather than early.

I think we'll have to open it up for discussion if there's no more from the panel - and remember gentlemen we are limiting these questions to these five points. Now these men are prepared on these five points and we are not going to answer questions which go beyond these five points. So if you would like to ask a question we want it within these five points and will try to answer your question. Direct them to the panel and we'll try to answer them.

(Question from the audience not loud enough to be intelligible on Soundsciber)

few remains that were dug up. I would say in many of the cases - now I'm trying to think of the one recently. Another Neanderthal Man, somewhere in the vicinity of Iraq, was dug up and practically all of the skull was complete. There was some evidence that the individual had suffered from the falling of the ceiling of the cave in which he was found. But evidently
