

them come together and produce one single cell from which they say, by accident, all the various productions of plants and animals that have come into existence have proceeded. And they have figured that it would take millions of millions of millions of years by pure accident for this to happen, and it can't be the earth is that old.

So Dr. Hoyle now says the original cells must have some way come to this earth from another planet! He's not ready to say that God must have made them. In the human body there are more cells than there are people in the world. IN fact, in every human body there are thousands of times as many individual cells as there are people in the world. Scientists tell us that ~~in~~ every one of the body cells in a person, every one of the thousands of thousands of thousands of cells that are in our body--every one of them has in it indications of the exact features of our body and mind which we will possess! We have many many genes which are found in every single body cell in the body. One will show the shape of your head; one will show the color of your hair; one will show the shape of your nose; one will show whether you are good in math or not.

All the various qualities that we have, individual genes within every cell of your body! How did all this come into existence? By accident? Jean-Paul Sartre, a noted French atheist who has received the Nobel prize for his writings--a strong anti-Christian, Sartre said the greatest problem that faces us is how does it come that ~~anything~~ there is anything that exists? Well, there's no answer except the answer that the Bible gives. That there is a great God, a God who created all things, a God who controls all things, a God who has a wonderful purpose in all things. If we have believed in Jesus Christ as Saviour, and been born again into his kingdom we can know that all things work together for good to those that love the Lord, and that whatever comes into our lives God is working it out according to His purpose and that sometime we will look back and praise Him for it, because then we'll see the reason for everything that happens in our lives.

So it is foolish to speak of a universe without a God who created the universe. But what kind of a God is He? Look at the universe and the evidence of His power is perfectly plain. The evidence of His intelligence is plain in the tremendous complexity of all that exists, and the definite rules and principles that run through it all. But what kind of God is He?

If we look at nature we may say, What a wonderful God He is! Look at the pleasant summer days we have. Look at the comfortable summer nights. Look at all the nice things in the world God has created. Look at the beauty of the scenery. What a wonderful God He is! Somebody else says, Look at the thunder storms. Look at the way that the animals are killed by great cataclysms. Look at the wars that have spread over the world. It's a terrible God who created a world like this! What kind of God is He? You could not tell by looking at nature. The only way we could tell what a kind of a God he is (there is) is by having a revelation.
