

his personality, that there will be an intercommunication between the two personalities. We expect any personality to be able to reveal himself. If it's scientific, however, to get information, seek information through revelation, must we not get all our information on all subjects from actual observation, from actual inductive study. This is a view which would not stand the test of examination. There is no one of us who has secured the smallest, more than a comparatively small fraction of his knowledge from his own personal inductive study and observation. In every science, every worker in it has secured at least nine-tenths of what he knows by revelation from other personalities. Others communicate to us ideas, conclusions, data and we build upon these data. We are used to the idea of revelation in ordinary life because we are constantly receiving communication and we would make little progress in any field of study without them.

Recently I visited the Mount Wilson Observatory in California. There I saw a telescope trained upon the sun. I was told that with this telescope pictures are taken every few minutes of the sun all day long. These pictures are studied in order that the sun may be studied and it may be told just what its situation is from time to time. Great storms that occur on the sun, tremendous changes, mighty upheavals are examined from time to time on the basis of these pictures. But these pictures are not enough. Other ~~p~~ telescopes stationed at various places around the world are taking pictures of the sun when they are facing in that direction. So that there is a series of pictures brought together from all over the world, in order to give a continuous record of the sun throughout the 24 hours. If one were restricted to what he could see of the sun from any one point in the world, his information would be insufficient to get a full picture of the story of the sun.

If a group of scientists were to stand on the shores of the Pacific Ocean and look over across toward China, and to try to tell us something about the country there, what kind of a land it is, what kind of people live there, is there after all any land there
